

Paris

As global temperatures rise, IIED is analysing what this means for some of the world's biggest capital cities. In this series, IIED examines rising levels of extreme heat in 20 cities over the past 30 years (1994–2023).

Note: while the global analysis contains the figures for the days Paris reached 35°C, this factsheet presents trends for the number of days over 30°C, to provide statistically significant results for Paris at an individual city level.

Total days over 30°C during past 30 years: 457

Total days over 30°C by decade:

- 1994–2003: 141
- 2004–2013: 127
- 2014–2023: 189

Based on a linear annual trendline across 30 years, the number of days over 30°C in Paris has **increased by 57%** during the past 30 years since 1994.

In the past decade (2014–2023), 6 out of 10 years experienced 20 or more days of at least 30°C. This contrasts with the previous two decades, both of which only experienced 2 years where this was the case.

Paris: Number of days over 30°C/year

Location of temperature measurement: Paris Le-Bourget Airport

Source: this analysis was conducted using daily weather data provided by [Custom Weather](#)'s Historical Data and Analytics. Custom Weather aggregates and presents daily weather data for cities, which are collected from a single airport location in each city. Airports are often the location of [official weather stations](#). This also allows comparability between cities.
